

Reset3 – Version 4 Scope (Productization & Public Launch)

Guiding Principle

Version 4 focuses on productization and public credibility — not feature expansion. Reset3 remains minimal and aligned with its prime directive: reduce decision friction.

In Scope (v4)

- Public deployment: Frontend deployed (e.g., Vercel) and backend deployed (e.g., Render/Fly.io) with secured environment variables.
- UI refinement: Centered layout, cleaner spacing, consistent typography, removal of dev/test elements (e.g., Test Backend button, debug UI).
- Visual polish: Remove unnecessary emojis, tighten headings, ensure professional visual identity.
- Simple history view (no dashboard): Date, Primary Move, Win/Incomplete status, and Cycles completed per day — list or minimal calendar layout only.
- Portfolio documentation: Updated README, architecture overview, version evolution summary (v1 → v4), and screenshots for job fair presentation.

Explicitly Out of Scope (v4)

- User accounts or authentication.
- Cloud sync beyond localStorage.
- Stripe or monetization features.
- Advanced analytics dashboards or behavioral scoring engines.
- Major AI feature expansion beyond current structured selection.

Strategic Position

Version 4 transforms Reset3 from a local development tool into a publicly accessible AI-backed decision system. The goal is credibility, clarity, and usability — not complexity.
