Reset3 v1.0 Notes

Personal + portfolio build notes • February 20, 2026

What Reset3 v1.0 does

Reset3 v1.0 is a portfolio-first web tool that turns a messy brain dump into a short, decisive action plan: 1 Primary Move + 2 Support Moves, ordered with short reasons. The tone is a direct coach: calm, firm, and decisive.

• Brain Dump: one large text area to unload everything on your mind (no structure required).

• Generate My 3: selects exactly 3 tasks and orders them as Primary + 2 Support moves.

• Today's 3: shows the ordered list with short reasons and checkboxes.

• Weekly Reset: a separate mode that outputs three weekly priorities (stored so you can reference them during the week).

• End-of-day binary outcome: WIN if Primary Move completed; otherwise INCOMPLETE.

Design guardrails: Reset3 is intentionally not a task manager, not a habit tracker, not account-based, and not a gamified points system. It wins by subtraction.

How v1.0 currently selects "My 3"

In v1.0, task selection is lightweight and deterministic (keyword and simple heuristics), not a full AI model call yet. This keeps the build simple and fast while validating the product behavior and daily habit.

Input	Heuristic (v1)	Output effect
Weekly outcomes	Keyword matching against brain dump	Boosts tasks aligned with the week
Brain dump lines	Basic parsing (one task per line)	Creates candidate tasks
Keywords (urgent/admin/money)	Simple keyword scoring	Can elevate "avoidance" tasks
No time estimates	No timing bias in v1	Selection can feel random when many tasks exist

Note: the exact scoring weights are intentionally minimal in v1.0. The point is to reduce decision friction, not to perfectly optimize tasks.

Data & persistence (v1.0)

• Local-first: data is stored in the browser (localStorage).

• Weekly outcomes persist and can be reused across sessions.

• Today's 3 persists until replaced by a new generation (implementation dependent on current code).

• Brain dump text does not persist after generation (known issue).

Known v1.0 issue discovered in real use: after generating My 3, the Brain Dump resets/clears. This creates rework (retyping 50+ items) and breaks trust. v2.0 fixes this first.

Known limitations (v1.0)

• No task lifecycle: completed tasks are not removed from the master list (because there is no master list yet).

• No optional estimated minutes, so quick wins vs deep work cannot be balanced.

• Selection logic is basic and not yet using a model API with structured JSON output.

• No export/import package (beyond what's currently saved locally).

Why v1.0 still matters (portfolio + personal use)

v1.0 proves the core interaction and product positioning: a two-minute reset that eliminates starting friction. It is intentionally minimal, so iteration is driven by real daily usage rather than feature creep.
