Reset3 – Version 3 Recap & Roadmap

What We Accomplished (Version 3 Foundation)

- Created and worked inside a dedicated v3 branch.
- Secured environment variables using .env and .gitignore.
- Built an Express backend running on localhost:3001.
- Kept Vite React frontend running on localhost:5173.
- Connected React to backend using fetch().
- Added Test Backend (v3) button to verify frontend and backend communication.
- Mapped backend response into existing Reset3 UI state.
- Preserved v2 local generator as fallback (no scope creep).

What Still Needs to Be Completed (Version 3)

- Replace main Generate button to use backend (not just test button).
- Add loading state and clean error handling.
- Harden backend response structure (consistent primary + supports + reasons).
- Integrate OpenAI securely using server-side .env key.
- Add basic guardrails (rate limiting, input size limits).
- Commit, push, and tag a stable v3 milestone.

Version 4 Vision – Real AI Engine

- Full AI-powered prioritization logic (not heuristic scoring).
- Context-aware weekly alignment improvements.
- Smarter avoidance detection and behavioral nudges.
- Light analytics: cycles per day and completion trends.
- Cleaner UI polish and performance optimization.

Version 5 Vision – SaaS-Ready System

- User accounts and authentication.
- Cloud storage (no longer localStorage only).
- Subscription model (Stripe integration).
- Admin dashboard for usage monitoring.
- Public launch positioning Reset3 as a decision-friction eliminator.
